Bengaluru, India

SUMMARY

Data Analyst with hands-on experience in SQL, Python, Power BI, and Excel — specializing in end-to-end analytics pipelines that turn complex datasets into clear business decisions. Proven ability to analyse 100K+ records, uncover hidden patterns, and communicate findings through dashboards that drive measurable impact. Passionate about data-driven problem solving and actively seeking Data Analyst roles in Bengaluru.

EDUCATION

Presidency University — Bengaluru

B.Tech in Computer Science and Technology

PROJECTS

Olist Brazilian E-Commerce Analysis

SQL-first analysis of 100K+ orders across 9 relational tables — uncovering delivery failures, revenue trends, and payment behaviour.

- Analysed ~100K orders across 9 relational tables using complex SQL joins, CTEs, and window functions before Python EDA
- Identified delivery delays as the primary driver of poor ratings — scores dropped from 4.29 (on-time) → 2.27 (late), an 8% late delivery rate with 10+ day average delay
- Detected a ~53% revenue spike in November 2017 via time-series analysis, confirming Black Friday impact and the need for seasonal demand planning
- Found São Paulo contributes ~37% of revenue and ~49% of customers; northern states averaged 26–28 day delivery times, flagging logistical inefficiencies
- Discovered ~74% credit card usage and ~19% Boletão — 1 in 5 customers rely on alternative payment methods requiring tailored pricing strategy
- Built executive-level Power BI dashboard with multi-page layout covering revenue trends, delivery performance, and geographic breakdown

Superstore Profitability & Discount Analysis

End-to-end retail profitability analysis — identifying loss drivers and discount strategy failures using Python, SQL, and Power BI.

- Analysed \$2.3M+ retail dataset to identify profitability gaps across sub-categories, regions, and customer segments
- Identified Tables and Bookcases as persistent loss-makers driving over -\$17K in combined losses across all regions
- Established discounting above 40% as the root cause of negative margins using correlation analysis (correlation up to -0.796)
- Found the Central region underperforming with a 7.92% profit margin vs 14%+ in other regions, flagging structural inefficiency
- Built interactive Power BI dashboard with YoY DAX measures, conditional formatting, navigation buttons, and a Key Findings page
- Wrote SQL queries using CTEs and window functions to rank sub-categories by loss, detect regional trends, and validate EDA findings

HR Employee Salary Analysis

SQL and Excel-only analysis of ~32K City of Chicago employee records — revealing compensation skew, pay hierarchy, and workforce imbalance.

- Processed and cleaned ~32,000 employee records using Excel Power Query — handling missing values, inconsistencies, and format standardization
- Used advanced SQL window functions (RANK, DENSE_RANK, NTILE, PERCENT_RANK) to segment salary distribution across departments and roles
- Identified heavily right-skewed salary distribution — a small subset of roles captures a disproportionate share of total payroll expenditure
- Revealed workforce concentration in a limited number of departments, flagging structural resource allocation imbalance
- Built 4-sheet Excel dashboard system (Raw Data → Analysis → Dashboard → Data Dictionary) for non-technical stakeholder navigation

SKILLS

Languages & Querying: SQL (MySQL), Python

Libraries: Pandas, NumPy, Matplotlib, Seaborn

BI & Visualization: Power BI (DAX, KPIs, YoY), Tableau, Excel Dashboards

Tools: Excel (Power Query, Pivot Tables), Jupyter Notebooks, GitHub, n8n

Competencies: EDA, Data Cleaning, Dashboard Design, Business Analysis, SQL Optimization, Window Functions
